

COMPUTER LABORATORY ACTIVITY

Activity Title: Performance Task 3: Peer-to-Peer Local Network and Web Application Deployment using XAMPP

Course: ITPC 17 / 118 - Systems Administration and Maintenance

Instructor: Jestoni Guyano / Bernie S. Balighot

Student Name(s): Armando V. Loro Jr.

Section: BSIT- 4A

Date Performed: 10/19/25

Date Submitted: 10/19/25

Purpose: The purpose of this activity was to establish a peer-to-peer connection between two computers using a UTP cable to enable direct communication and file or system access without needing an internet connection. It aimed to deploy and access a web system hosted on one computer (using localhost or IP address) from another computer within the same local network, demonstrating how systems can interact and share resources over a LAN setup.

Tools and Material Used

List all hardware, software, and materials used in the activity. Example:

- Laptop1 (Windows 11)
- Laptop2 (Windows 11)
- Ethernet Cable (Cat6e)
- XAMPP
- Browser (Google Chrome)
- PHP-based CodeIgniter 4 (DENR- Agricultural Transport Management) Host
- PHP-based CodeIgniter4 (CCIS-A Web-based Classroom Management System)- Client

Procedure Summary

Briefly describe the major steps you performed

1.	Connect with UTP cable crossover the Laptop A and Laptop B
2.	Assigned the IPv4 of Laptop A into 192.168.1.1, subnet mask 255.255.255.0, default gateway 192.168.1.2 and the dns into 192.168.1.2, also assigned the IPv4 of Laptop B into 192.168.1.2, subnet mask 255.255.255.0, default gateway 192.168.1.1 and the dns into 192.168.1.1
3.	Ping the the ip address of laptop A into laptop B to as same as the laptop B into laptop A tp ensure the connection is connected between the devices by typing it in cmd.
4.	In the Control Panel of XAMPP and Start the Apache and also the MySQL and then Access the localhost/phpmyadmin
5.	Run a project to ensure that the database is connecting
6.	Access the Laptop B project in the Laptop A
7.	After Accessing the Laptop B project the Laptop B now access the project in Laptop A and before that check first the public and private in the Windows Defender Firewall, Allow app access
8.	Test the project function in both computers

COMPUTER LABORATORY ACTIVITY

SCREENSHOT EVIDENCE (with Captions)

Step 1

Assign the IP Address into 192.168.1.1 and then Subnet Mask 255.255.255.0 and the the Default Gateway 192.168.1.2 and the DNS server 192.168.1.2 and them click Ok.

Step 2

Type cmd in Windows search bar to open the terminal and then type ping 192.168.1.2 to ensure the connection in the Laptop B.

COMPUTER LABORATORY ACTIVITY

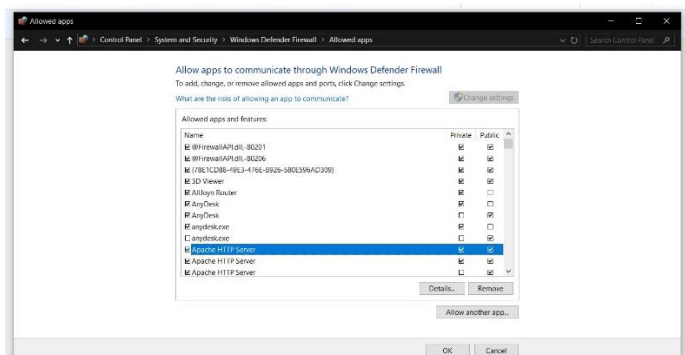

Step 3

Here I run the Apache and MySQL in XAMPP Control Panel

Step 4

I run my project first to ensure the port is running properly

Step 5.

This done in Laptop B to access the project of Laptop B in Laptop A
Go to Windows Defender Firewall and then click Allow and app or feature through defender firewall and then check the public and private

COMPUTER LABORATORY ACTIVITY

Step 6.

Successfully Access the Project System of Laptop B in my Laptop A

Step 7

Here I perform CRUD in the system

COMPUTER LABORATORY ACTIVITY

Result and Discussion

Answer the following guide questions in 2–3 sentences each:

- 1. Was the peer-to-peer connection successfully established? What verification did you use?**

Answer: Yes, the peer-to-peer connection is successfully established by pinging the IP Address of both computers and it reply with no error

- 2. What challenges did you encounter in configuring the network or XAMPP? How did you resolve them?**

Answer: : For me, the challenges I face is when I running the system in my Laptop from the Laptop of may pair because it always display in the browser that connection is failed. I resolve them by checking the public and private in allow app and features through defender firewall.

- 3. How did you confirm that each computer could access the other's system successfully?**

Answer: I confirm it when I running the IP address of the Laptop of my partner in my browser and then successfully displaying the project of him in my Laptop

- 4. In real-world scenarios, when would a peer-to-peer setup be preferable to a switch-based network?**

Answer: Yes, I already experience it when I'm in Senior High School and out teacher let us perform this

- 5. What security measures could be implemented if this system were used in an actual organization?**

Answer: If a peer-to-peer (P2P) system were used in an organization, strong security

COMPUTER LABORATORY ACTIVITY

measures would be essential. Data should be protected with end-to-end encryption and secure authentication to ensure only authorized peers can connect.

COMPUTER LABORATORY ACTIVITY

Conclusion

Summarize what you have learned from this activity regarding network setup, local web deployment, and system accessibility between computers.

From this activity, I learn oh how to configure an IP and folder sharing and then accessing the project by local from one laptop to another laptop

Group Members and Individual Contribution

Member Name	Task/Contribution
Armando V. Loro jr.	The one that perform the peer-to-peer network accessing the System of the Client computer named Money Transfer System
